EDUCATION

Bachelor of Science in Computing Science, University of Alberta September 2022 – June 2025

Relevant Coursework: Web Design & Development(AUCSC 218), Software Engineering(AUCSC 220), Networks & Security(AUCSC 455), Data Structures and Algorithms(AUSCI 235)

WORK EXPERIENCE

Full-Stack developer, Rentino, Remote **September 2025 - Present**

- Architected and built the backend API using Django/DRF, applying clean layered separation (API → service → repository) that reduced onboarding time for new contributors by ~40% and cut code-review churn by 30%.
- Designed PostgreSQL schemas with ACID-compliant transactional writes, eliminating race conditions across booking, payment, and inventory operations — reducing data-integrity incidents to zero since launch.
- Analysed AWS CloudWatch metrics, right-sized EC2 instances, implemented auto-scaling policies, and migrated static assets to S3/CloudFront, collectively reducing monthly AWS infrastructure costs by 50%.
- Containerised all services with Docker Compose for local parity and deployed to AWS ECS with structured logging (CloudWatch) and health checks, achieving 99.5% uptime across staging and production environments.
- Wrote unit and integration tests (pytest, coverage.py) achieving 85%+ code coverage on critical payment and booking flows, reducing post-release bug reports by 45%.
- Implemented OAuth 2.0 / JWT authentication with role-based access control (RBAC), securing multi-tenant data access and passing an internal security audit with zero critical findings.
- Integrated Celery + Redis task queue with a beat scheduler for asynchronous job processing, cutting average API response time by 30% and enabling retry-safe automation for time-sensitive operations.

Software Developer, Confidential Client (B2B SaaS), Remote **August 2024 – September 2025**

- Delivered production-ready features across 3+ release cycles using a React/TypeScript front-end and Django REST back-end, improving UI consistency and reducing post-release defects by an estimated 30%.
- Built interactive scheduling views with optimistic UI updates and client-side caching (React Query), cutting average calendar-load interaction time by over 50% and reducing perceived latency significantly.
- Diagnosed and resolved recurring data and UI regressions through structured Git workflows, automated linting (ESLint, Black), and pre-commit hooks, reducing repeat issue reports by approximately 40% over three months.
- Introduced Sentry error monitoring and Datadog APM dashboards, reducing mean time to detection (MTTD) for production issues from hours to under 15 minutes.
- Migrated legacy REST endpoints to a versioned API design with OpenAPI/Swagger documentation, enabling two external partners to self-integrate without engineering support.

Junior Freelancer, UpWork, Remote **January 2021 - November 2023**

- Delivered responsive website builds and feature updates for 10+ clients across diverse industries, achieving first- or second-revision approval on 90% of deliverables through clear scope alignment and design fidelity.
- Resolved CSS/HTML and cross-browser compatibility issues across Chrome, Firefox, and Safari, reducing mobile-viewport layout breaks by roughly 60% on actively maintained client projects.
- Integrated third-party APIs (Google Analytics 4, Hotjar, Mailchimp) into 5+ client stacks, enabling new data flows that saved each client several hours per week of manual reporting overhead.
- Optimised Core Web Vitals (LCP, CLS, FID) for three e-commerce clients, achieving green Lighthouse scores and contributing to an average 18% increase in organic search traffic within 90 days.

PROJECT EXPERIENCE

HackED 2025 - (Hackathon) - https://github.com/kuznimyk/mixed-baddies_fixed.git

Flask - MongoDB Atlas - PyMongo - JavaScript - Bootstrap

- Designed and built intuitive UI screens for a student gig marketplace within a 24-hour sprint, iterating rapidly on peer feedback while maintaining design consistency across all views.
- Implemented data-driven rendering and partial UI refresh patterns to deliver fast, responsive interactions across key marketplace views, reducing perceived load time and improving overall user experience.
- Maintained a consistently shippable main branch throughout the hackathon using structured Git workflows and CI checks.

SKILLS

- **Front-end:** React 18, TypeScript, Next.js, Tailwind CSS, HTML5, CSS3, Redux, React Query
- **Back-end:** Python, Django, Django REST Framework, Flask, Node.js, Express.js, GraphQL
- **Databases:** PostgreSQL, MySQL, MongoDB Atlas, Redis, Elasticsearch
- **Cloud & DevOps:** AWS (EC2, ECS, S3, CloudFront, RDS, CloudWatch), Docker, Kubernetes, GitHub Actions, CI/CD
- **Testing & QA**: pytest, Jest, React Testing Library, Cypress, Postman
- **Monitoring & Obs.:** Sentry, Datadog, CloudWatch, Structured Logging, APM

Certifications & Additional Training

- **DevOps Course – EPAM Systems**
  Date Completed: March, 2022
  CI/CD pipelines, cloud infrastructure, containerisation, and modern DevOps automation practices.
